

Make a python app based project on DETECTION ALGORITHM: Handwriting differentiation and analysis where it employs handwriting analysis techniques to detect and differentiate between various handwriting styles in exams. The working of the app would be - a pleasant user interface where there would be content just like a normal *64 based app and then 2 insert pdf function to insert the pdf and scans the text from the pdf and compares them and then fills the user with the information about how accurate both the pdfs are and displays the text from both the pdf and highlights the same or accurate words.
